1. **Selected SDG and Reason for Selection-**
    - Quality Education.
    - Only one people can access and manage the system.
    - So that the system can work properly and better security can be provided to the system.

2. **Problem Statement (Important Section)-**
    - When many people access a system, security is not provided to that system and people also get confused about how to access it because the skills and knowledges of different people are different.
    - This problem is mostly seen in software fields, where multiple data must be accessed and secured.
    - Developers, Software Engineers etc.
    - This is Serious because it introduces harmful viruses into the system and sometimes even deletes data automatically, causing the system to hang.
    - If this is not solved, then all the data files in the system will not be able to function properly and the system will also not be able to function properly.

3. **Proposed Solution-**
    - My Project name is “Admin-Access-System”.
    - This system will have frontend, backend and database. Whatever inputs you give in the frontend will be kept and in the backend the data will work in the server and the data will be saved in the database.

      In this, any user will create his name, email and password, then on clicking the register button he will get registered, then he will login by entering his email and password, after that the dashboard will open in which the user's name, email and total users count will be shown. There will be a logout button by clicking on which the user can logout. Apart from this, our main focus will be on the admin panel in which all the data will be saved, which only the admin can access (update, delete, save) by logging in with his email and

password. There will also be a search option in this, using which the admin can easily find the user.

The data of all the registered users will be saved in the database.

- The more users there are, the easier it will be to access their data. Since there's only one person accessing them, they can easily log in and access them. If a user registers more than once, the data can be deleted. If the email or password is incorrect, it can be corrected by contacting the administrator.
- This system is used by admins, developers, and users who want to know about it can use it.

4. Project Features-

- Users Registration:- All the users of this project or system will enter their name, email, then create a new password and then login using the same email and password.
- Data Dashboard :- In my project, users will only be able to access the dashboard after they have entered their correct email address and password and logged in. Once logged in, the dashboard will open, displaying the user's name, email address, and a count of the number of registered users. There will also be a logout button, which users can easily log out of.
- Complaint Submission :- If the users faces any kind of problems, then he can contact the admin and share his problems, then the admin will solve his problems.
- Resource Recommendation :- Resource recommendation in an Admin-Access-System refers to suggesting or allocating appropriate system resources (such as users, data, tools, or services) based on requirements.

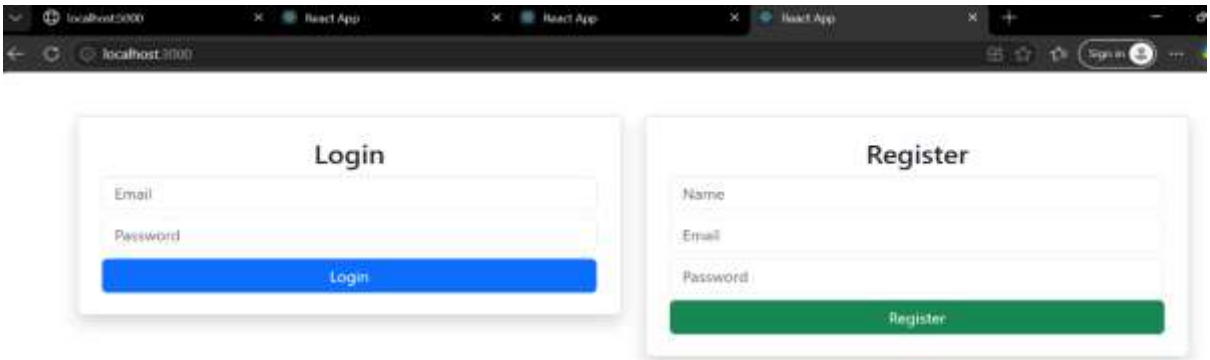
5. Technology Stack-

- Frontend :- HTML, CSS, JavaScript, Bootstrap, React.js.
- Backend :- Node.js, Express.js.
- Database :- MongoDB.
- Authentication and Security :- JSON Web Token (JWT), bcrypt.

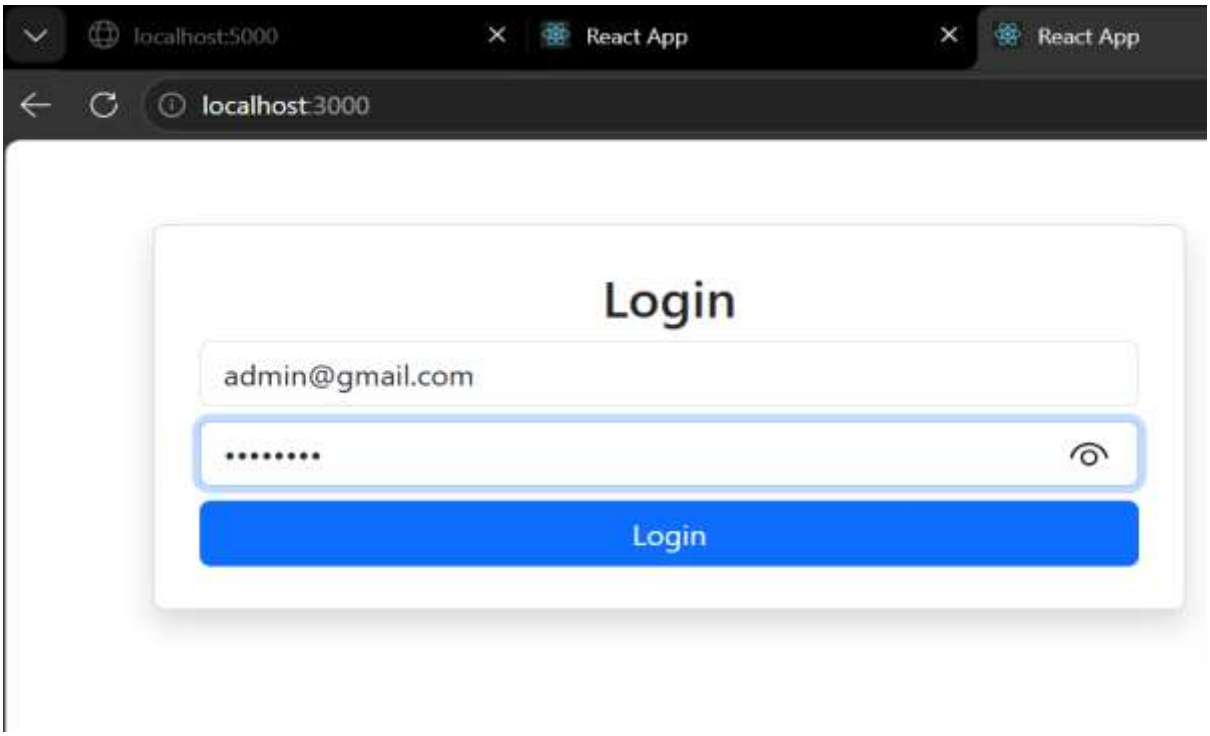
- Tools and Software :- VS Code, Postman, MongoDB Compass.
- APIs :- REST APIs – GET, POST, PUT, DELETE.

6. Project Screenshorts (Proof of Work)-

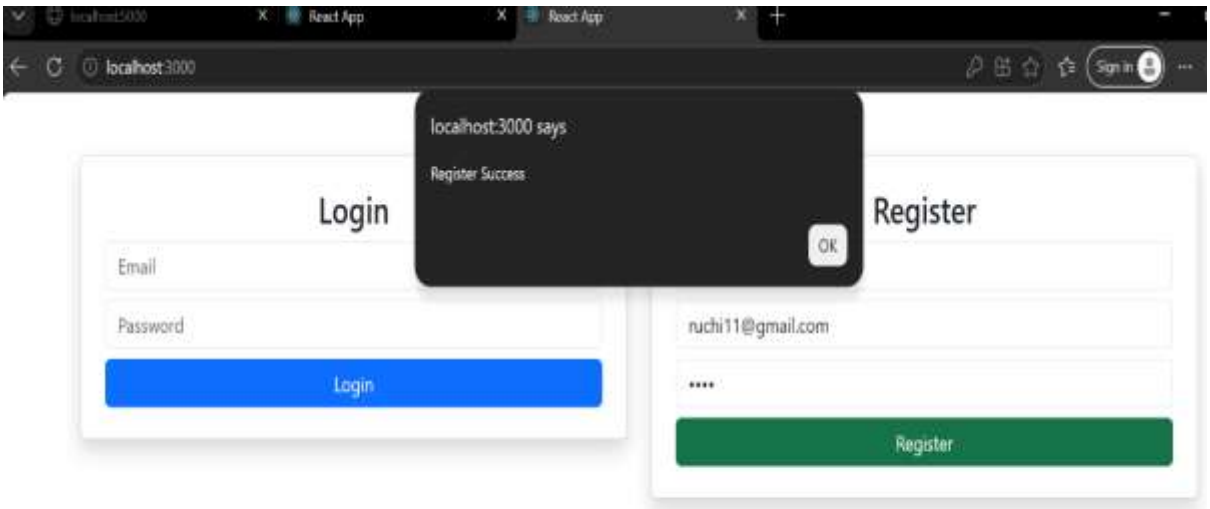
- Homepage or interface :-



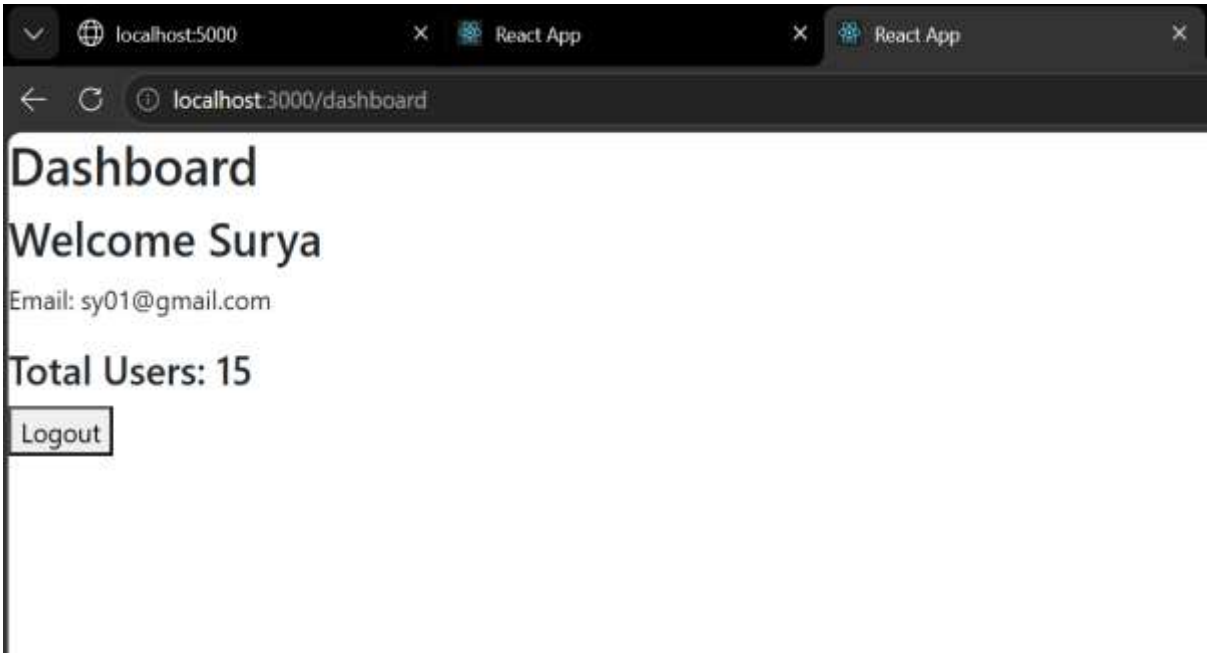
Admin Login:-



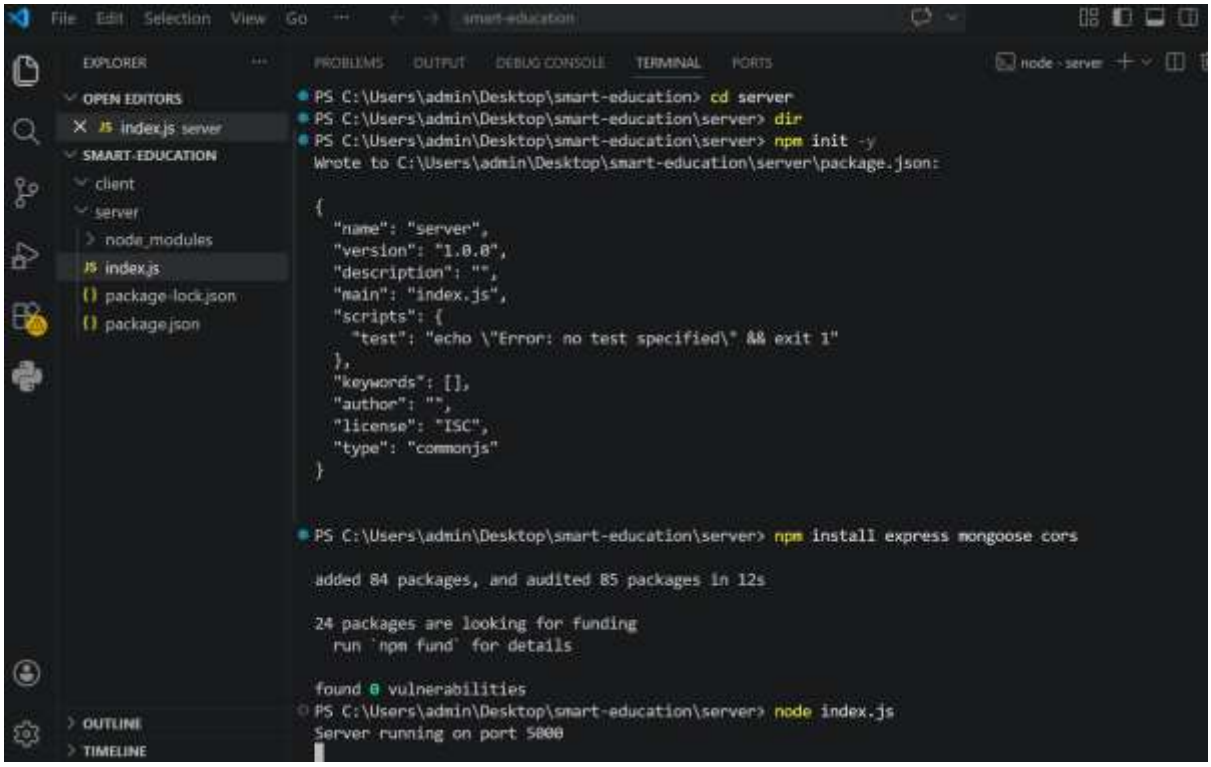
User Registered:-

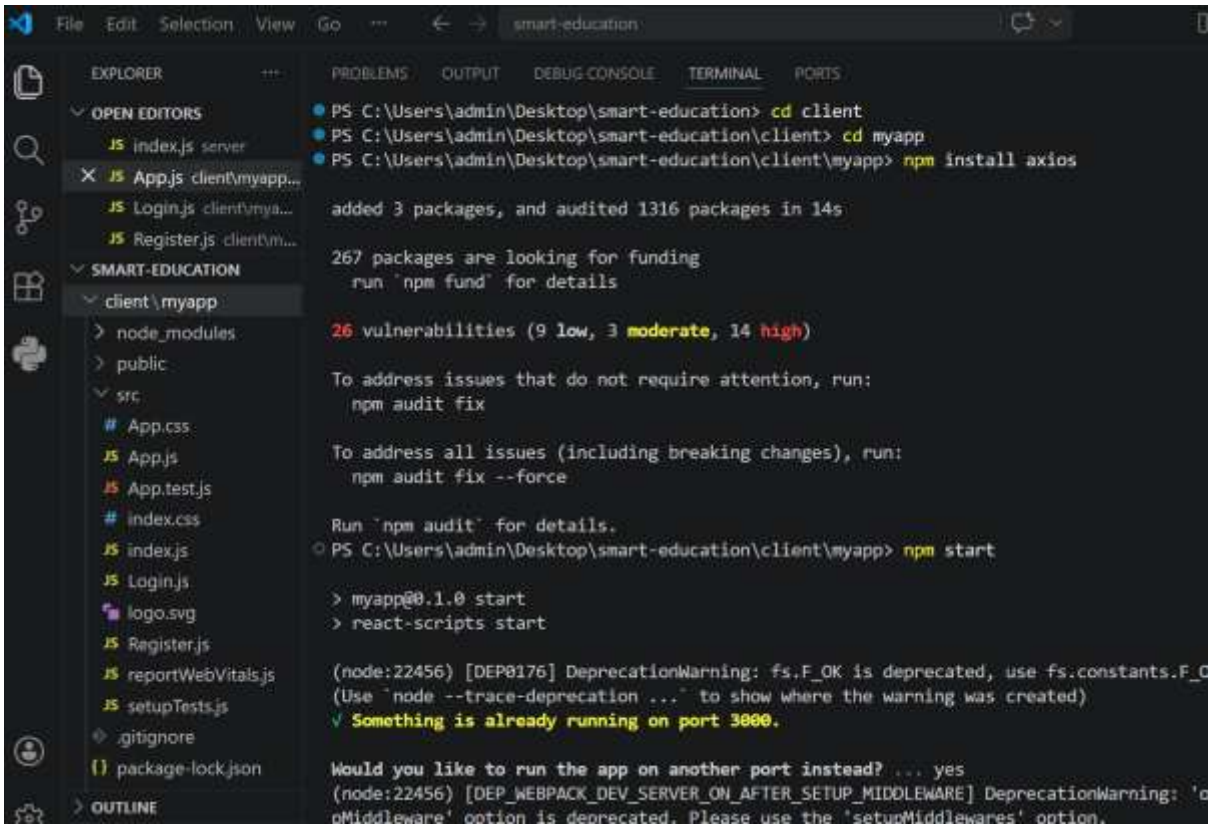


User Login:-



- Key Features of the system:-





```
PS C:\Users\admin\Desktop\smart-education\client\myapp> npm install axios
PS C:\Users\admin\Desktop\smart-education\client\myapp> npm start

> myapp@0.1.0 start
> react-scripts start

(node:22456) [DEP0176] DeprecationWarning: fs.F_OK is deprecated, use fs.constants.F_OK instead
(Use `node --trace-deprecation ...` to show where the warning was created)
√ Something is already running on port 3000.

Would you like to run the app on another port instead? ... yes
(node:22456) [DEP_WEBPACK_DEV_SERVER_ON_AFTER_SETUP_MIDDLEWARE] DeprecationWarning: 'onAfterSetu
pMiddleware' option is deprecated. Please use the 'setupMiddlewares' option.

Starting the development server...
Compiled successfully!

You can now view myapp in the browser.

  Local:            http://localhost:3002
  On Your Network:  http://10.34.198.132:3002

Note that the development build is not optimized.
To create a production build, use npm run build.

webpack compiled successfully
```

```
PS C:\Users\admin\Desktop\smart-education> cd server
PS C:\Users\admin\Desktop\smart-education\server> node index.js
Server running on port 5000
PS C:\Users\admin\Desktop\smart-education\server> node index.js
Server running on port 5000

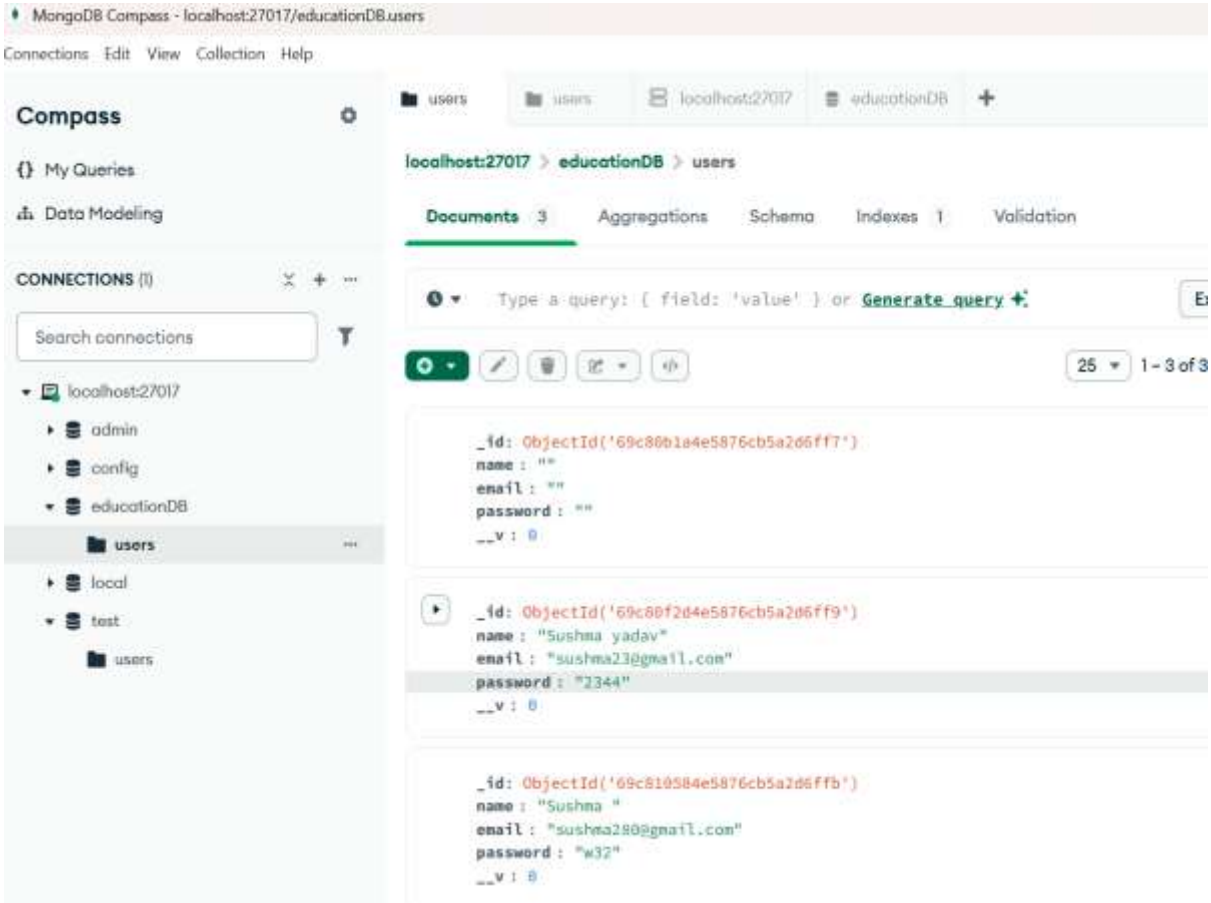
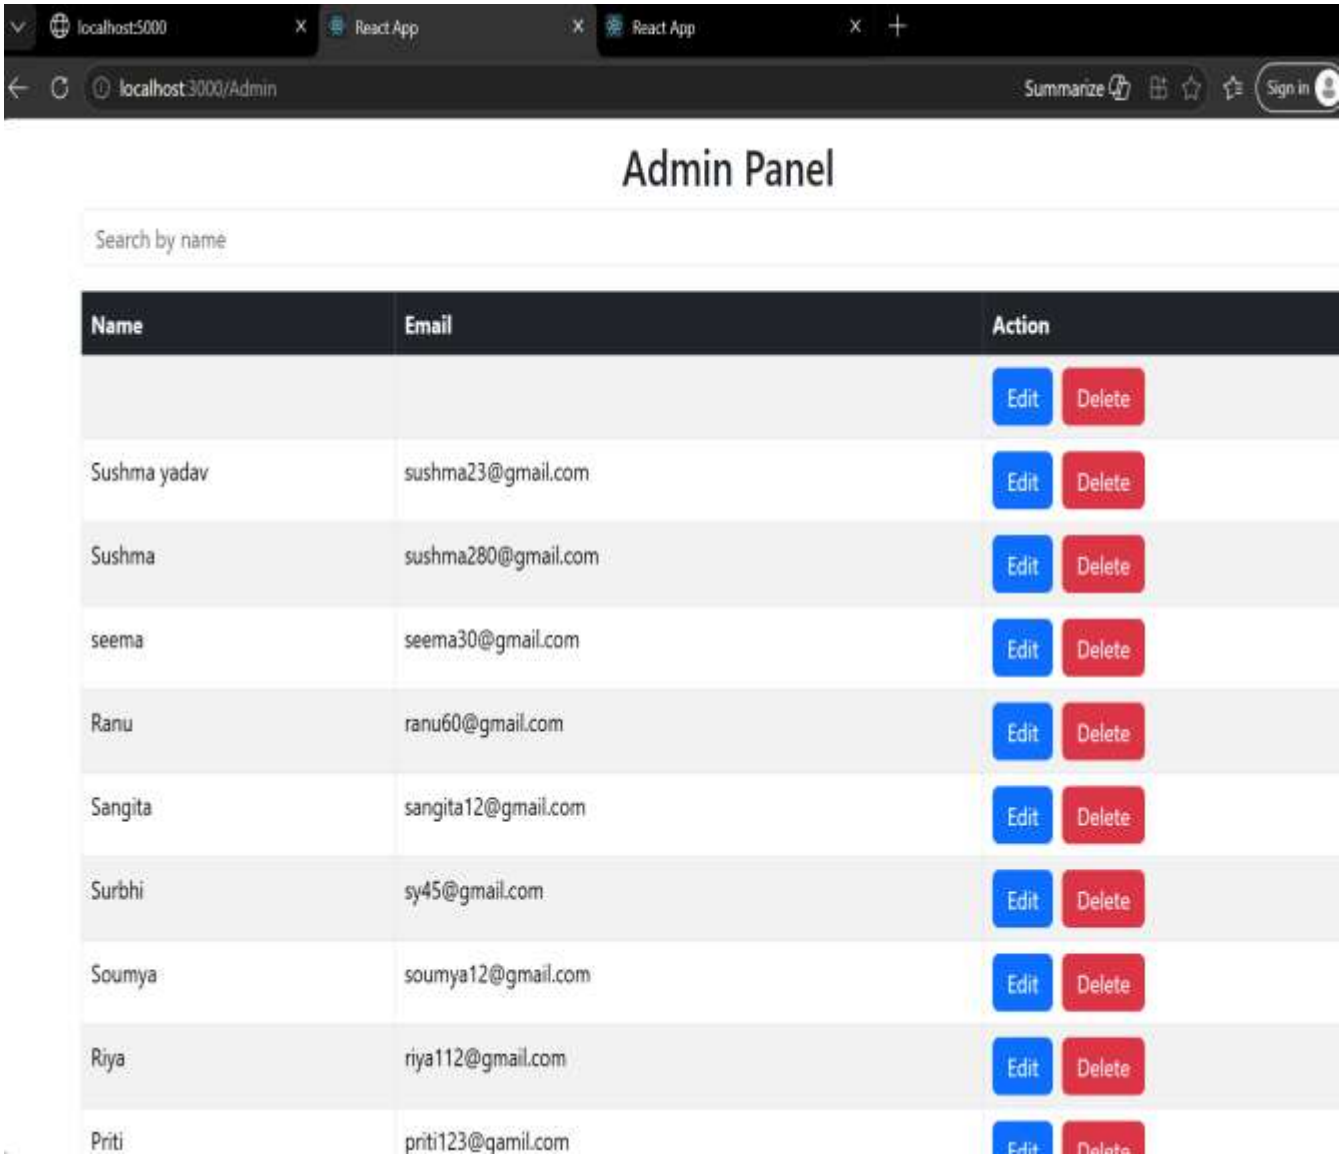
- User interactions:-





7. Open Source Repository-

Github Profile:- **https://github.com/sushmayadav4943-eng/Admin-Access-System.git**

8. Future Scopes-

- Advanced Security Features.
- Role-Based Access Control.
- Cloud Integration.
- Real-Time Monitoring.
- Integration with other Systems.
